

COVID-19 Global Impact Dashboard

Executive Summary | 22 Jan 2020 – 27 Jul 2020

COVID-19 GLOBAL IMPACT DASHBOARD

Historical analysis of confirmed cases, deaths, recoveries and active cases | 22 Jan 2020 – 27 Jul 2020

DATA ANALYTICS PROJECT

CONFIRMED CASES

16,480,485

Global total at final date

TOTAL DEATHS

654,036

Global total at final date

RECOVERED

9,468,087

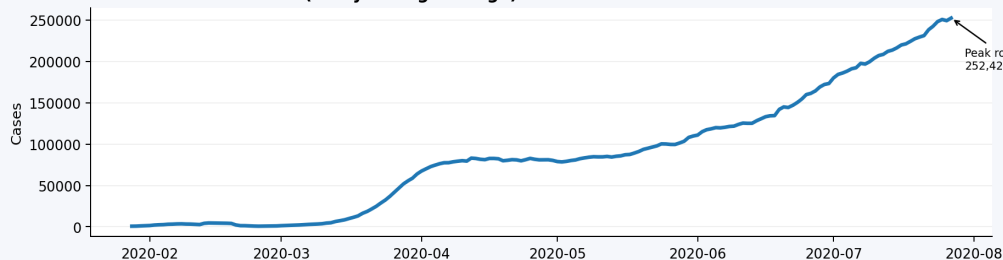

Global total at final date

ACTIVE CASES

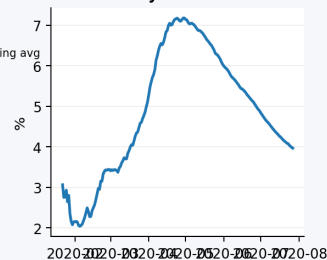

6,358,362

Global total at final date

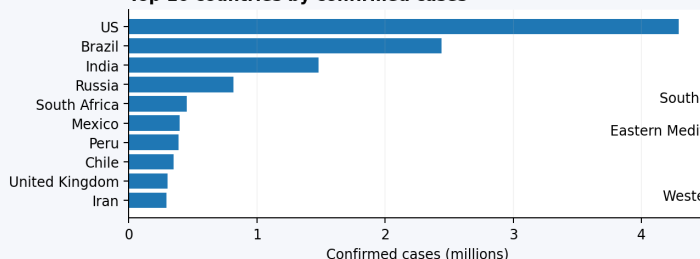

Global new-case trend (7-day rolling average)

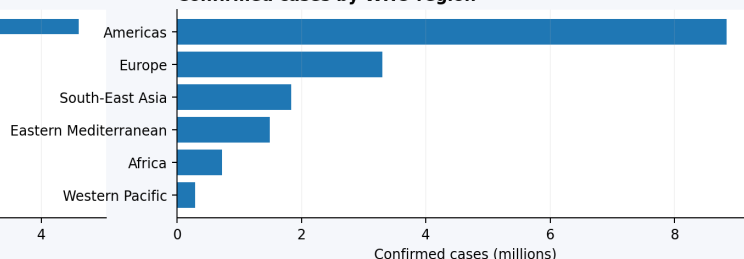

Case fatality rate

Top 10 countries by confirmed cases

Confirmed cases by WHO region

Project question

How did the global COVID-19 case trajectory evolve, and which countries and WHO regions accounted for the largest cumulative case burden by the end of the available period?

Key findings

- Final global totals: 16,480,485 confirmed cases, 654,036 deaths, 9,468,087 recovered and 6,358,362 active cases.
- Peak daily new cases: 282,756 on 23 Jul 2020; peak daily new deaths: 9,966 on 23 Jul 2020.
- The highest 7-day rolling average of new cases was 252,425 on 27 Jul 2020.
- At the final date, the cumulative case fatality rate calculated from global totals was 3.97%.
- The supplied country table contains 187 countries/regions at the final date.

Data quality & limitations

The archive contains six CSV files. The daily and country-level tables reconcile on final cumulative totals. The complete time-series contains missing Province/State values and some negative numeric entries that can represent retrospective reporting corrections; these were not silently replaced. The supplied archive has no vaccination variables, so vaccination rollout analysis is explicitly excluded rather than inferred. This is a historical dataset ending 27 July 2020 and should not be presented as current surveillance.

Tools: Python (Pandas/Matplotlib), Excel. Outputs are designed for GitHub, internship submission, and presentation.
